

GREEN CATCH 3PHASE HYBRID APPLICATIONS

GREEN CATCH 3PHASE HYBRID APPLICATIONS

We do not recommend Green CATCH to be installed on 3phase hybrid applications

Green CATCH is only single-phase device. In typical applications on 3-phase sites, Green CATCH will see one-third of the available surplus.

All inputs to Green CATCH must be fed from the same phase. This means that Green CATCH will only see surplus from the connected phase, if a system is 15 kW's Green will see the equivalent of a 5 kW system.

Many batteries are single phase, and battery energy is distributed through a process referred to as Net metering. Due to this process, Green CATCH never sees true diversion numbers and this can result in grid imports.

For these reasons, we advise against using Green CATCH on 3-phase hybrid sites.
